--- Creating good HTML templates for email use: ----

Ever wonder why those annoying fancy marketing emails always look good in
your email client?
Here are a few email design tips to help you look like a pro.

--- Use Inline styles: -----

Always use "inline" CSS styles when designing an email template. Do not
place CSS styles in the HTML <head> tag, and do not link to external CSS
files. Many email clients cannot use head tag CSS or external files.

An example of an "inline" CSS style for a paragraph is:

```
<p style="font-face:arial, helvetica, serif; font-size:10px; font-  
weight:bold; padding:5px">Hello user</p>.
```

This means your design style is always "inline" with the page elements.
Inline styles guarantee your created HTML email will always look nice in
all email clients.

--- Use a table for the email body contents: -----

The body of your email should always be contained in a <table> to ensure
design layout consistency.

All Divs, paragraphs etc should be inside the table.

Take a look at the included example templates for correct layout using
tables, Divs and inline CSS.

--- Do not use inserted images in the reminders: ---

Password Reminder PRO does not allow using images directly in the email
reminders!

All email clients block displaying of images, and many anti-spam gateways
block emails that contain images.

Using images in the email increases image size and takes up space on your
mail server storage.

If you need to use images in your reminder emails to users, host the
images on an external web server and place links to the images in the
email body.

This will guarantee high-deliverability of the reminders to users and keep the message size small.

Thanks,
